GEOLOGY – Future Continent
Joy Wulke

Terra Mirabila, a multi-media presentation illustrating the geological story of Stony Creek Granite back through complex sequence of geological events that spanned some 600 million years of early history. From the previous super continents, Gondwana to Pangaea, to the upcoming super continent with its central shared ocean, nothing in geological history stands. Forms melt like mists, solid lands like clouds, shape themselves and go. Human alterations of the environment cannot compare with such feats of nature as the moving of continents or, much less, the creation of the world’s ever changing geological form.
